

iSeries AV Cables and Adapters – Perfect Union of Form and Function

Modern Haptics and Aesthetics for State-of-the-Art Technologies

Originally introduced as a small range of Apple-specific signal adapters, the iSeries has since evolved into a full range of state-of-the-art signal cables and adapters. The basic principle of providing compact, lightweight and aesthetically pleasing solutions for modern devices has consistently been maintained. With these new additions to the range, pretty much any signal format can now be transmitted or converted –

from cutting-edge USB-C up to legacy VGA, regardless of the source or display device's brand. With support for the latest specifications, all devices connected with iSeries cables and adapters can always perform at their maximum capabilities – and they still look great while doing so!

State-of-the-Art

The AV cables and adapters are fully compliant with the current standards of the respective signal type and thus fully compatible with the latest device generations.

Protects Valuable Equipment

All adapters are equipped with a short Port saver cable that has an extremely small bending radius. This ensures maximum flexibility and protects device sockets from damage.

Modern Aesthetics

In order to not only technically but also visually be in harmony with any constellation, iSeries products are available in the colours white and black by standard.

Mobile First

The small cable diameter makes the cables and port saver adapters low-profile, lightweight and portable – perfect for mobile applications.

Haptics for Practical Use

The development of iSeries products is always focused on practical usability, providing a ProAV range of functions with the look and feel of consumer products.

Install. Connect. Perform.

Gold-plated precision contacts, high-purity inner conductors and a triple shielding structure ensure that it all simply works.
